

- Computer:- It is an electronic device that can perform a variety of tasks by executing a given set of instructions.

→ Characteristics:-

1) Speed.

2) Accuracy.

3) Reliability. (Trustworthy).

4) Storage capacity.

5) Versatility:- It can perform multiple tasks.

Internet

(Inter-network)

→ Network: When we connect two or more computers ~~through~~ together to share data or resource is called a network.

→ Internet: It is the global network of computers connected together. It allows computers ~~all over the world~~ to communicate and share info.

WWW: It stands for (World wide web).

→ It is the collection of webpages.

→ URL (Uniform Resource locator).

* → It is the ~~Address~~ Address of a Webpage.

→ Difference between Internet and WWW:-

1)- WWW is one of the service provided by the Internet. Internet is the infrastructure (the roads and the wires), while the WWW is the service that runs on it (like cars running on the road).

→ Features of WWW:-

1) Hypertexts and Hyperlinks:-

- We can click links and jump to related pages easily.

→ Hypertext:- It is the text that contains links to other texts or documents. It may include words phrases or sentences that can be connected to other documents.

e.g. An online Article where certain words are clickable.

• Hyperlinks:- It is the actual clickable link in the Hypertext. It can be text, an image.

An icon or a button.

e.g. Clicking on "Read more" that takes you to another page.

★ → Hypertext → Text that contains links. -

★ → Hyperlink → The link itself. -

2) Availability of Content: Information on the web is available ~~every~~ ^{any} time (24x7)

- Anyone with the Internet can access it.

3) Worldwide Access: You can open websites from any part of the world. It is not

limited to one place.

4) Use of a common language:- (HTML).

Webpages are created using HTML, which makes all ~~websites~~ follow a similar format so they can be opened on any device.

5) Interactive platforms:

WWW ~~it~~ allows interaction through ~~forms~~ forums, chats etc. Which brings people together who share common interests from across the globe.

6) Universal standard:

WWW uses ~~HTML~~

HTML → For writing web content.

HTTP/HTTPS → For safe and proper transfer of information between the browser and the website.

→ IP :- (Internet Protocol).

Web terminologies:-

1) Webpage:- It is a digital page that contains text, Hyperlinks, Videos, Audio, Images, etc.

It is written using HTML and stored on a web server. Each webpage is identified by a unique web address called the uniform Resource locator (URL).

Website:- A collection of related webpages under one domain name. Each website

is owned and managed by an individual individual, company or an organisation.

- 3) Homepage:- The main/first page of a website is called a Home-page. It acts like an entrance. It contains the main information about a website and provides links to other pages of the website. The URL of the Home-page also serves as the URL of the website.

e.g. HTTP://www.microsoft.com

- 4) Web browser:- A software used to access and view webpages. It is an interface

between a user and world wide web. (WWW).

e.g. Google Chrome, Mozilla fire fox, Microsoft edge, safari, etc.

5) URL:- The address of the webpage.

e.g. * <http://www.Google.com>.

(5) Search Engine:- A tool that helps to search information on WWW.

e.g. Google, Bing, Duck Duck Go, etc.

(6) Web Server:- A computer system that stores websites and sends webpages to other client or browsers.

(7) Web Portal:- A website that provides multiple services from one place. Unlike a Website, It does not contain information on a given topic. Instead it suggests webpages where the user can find the desired information.

e.g. Yahoo!, Student portals (Admission, Exam forms, results, etc).

(8) HTTP:- It is the communication protocol used to transfer web pages on the WWW.

When we type a website address in the browser, HTTP tells the server and the browser how to communicate.

HTTPS (HTTP Secure): It adds encryption for safety. It is used in banking, shopping, login pages, etc.

(9) TCP/IP: (Transmission Control Protocol/Internet protocol).

- It is a set of communication rules that governs how data travels ~~across~~ across the internet. It makes sure:

- Data is broken into packets (TCP).
- Packets ~~to~~ travel efficiently across network ~~(IP)~~ (IP).

- Packets reach the correct destination and

are reassembled correctly (TCP).

→ In simple words, TCP/IP → Highway rules of the internet.

TCP → Cuts the data into packets.

IP → Sends packets to the correct address.

(10) Web Addressing System: It is the system designed by IETF (Internet Engineering task force), used to identify and locate each computer system connected to the Internet by providing unique addresses to each computer.

It includes URL, Domain name, IP address, protocol.

(10.a) IP address: (Number Addressing system).

→ It is a unique number given to each computer on the internet by IETF. It is a 32 bit number (IP v4) written as four numbers separated by dots (·). Each number ranges from zero to 255.

e.g. 25.110.2.1, 205.98.50.31

- The IP address can be directly used to access the webpage instead of typing the domain name. Computers understand IP address, not names.

~~12/04/20~~

(10.6) Domain Name: It is a unique name/human friendly name given to each website. It is easier to remember than IP addresses.

e.g. Google.co.in, Wikipedia.org.

- Parts of a Domain name:

- It has two parts:-

① Name of the Domain:-

- Comes before the Dot (.) symbol.

e.g. Google.

② Extension:- It comes after the dot (.) symbol.

e.g. .Org, .in.

→ Some Common Domain Extensions:-

(10.c) Domain name System: It is a system which converts domain names to IP addresses. It works like a phone book of the internet. e.g. When we type WWW.bing.com, DNS finds its IP address and connects us to the website. (The DNS also uses the country code to specify the country by using two letters in its extension.

e.g. India (.in)
United States (.us)
France (.Fr)
Japan (.jp)
Australia (.au)
United Kingdom (.uk).

Date ____/____/____

⇒ Rules for Deciding a domain name:

- 1) It consists of letters (a-z) and numbers.
- 2) Hyphen (-) is the only special character allowed in a domain name.
- 3) A domain name cannot contain more than 64 characters.
- 4) A domain name must have a valid domain extension.

~~U.S.A.~~

~~09/04/20~~

- HTML: (Hypertext Markup Language).

↳ It is a tag based language used for building different websites.

→ GML → in 1980's
(General Markup Language).

→ SGML in 1986.
(Standard Generalised Markup language).

- Later: → HTML - Made by Tim Berners Lee in 1995.

⇒ HTML5 W3C

↳ (Worldwide web Consortium).

↳ WHATWG (Web Hypertext Application technology working Group).

→ HTML Editors:

① WYSIWYG Editor: (What you see is what you get).

eg Word Press, Wix, Google Web Designer.

Q. Text Editors:-

e.g. Notepad, Notepad++, Atom, etc.

⇒ Tags:-

Container tags/Non empty tags.

Empty tags

• They have both closing and opening tags.

• There is only opening tag, No closing tag.

- </head> → Closing tag.

- <head> → Opening tag.

⇒ General Structure of an HTML Document.

<HTML>

<Head>

<Title> ... </title>

</Head>

<body>

≡

</body>

</html>

⇒ Headings Tag: (<h1> to <h6>)

<html>

<head>

<title> Class 9th </title>

</head>

<body>

<h1> Hello, My name is Asim </h1>

<h3> Hello, </h3>

<h2> Hello, </h2>

<h4> Hello, </h4>

<h6> Hello, </h6>

<h5> Hello, </h5>

</body>

⇒ Paragraph Tag and Center tag:

- Paragraph Tag: `<P> ... </P>`

- Center Tag: `<center> ... </center>`

ex `<html>`

`<head>`

`<title> Class 9th </title>`

`</head>`

`<body>`

`<h1> Hello my Name is Aasim </h1>`

`<p> I study in class 9th. I live in Baramulla and I love to play Cricket. </p>`

`<center> Thankyou! </center>`

`</body>`

`</html>`

⇒ Output:-

hello my name is Aasim.
I study in class 9th. I live in
Baramulla and I love to play
Cricket.

Thankyou!

⇒ Formatting Tags:

(1) Italics Tag: `<i> --- </i>`

e.g. `<html>`

`<head>`

`<title> class 9th </title>`

~~`<body>`~~

~~`</head>`~~

`<body>`

`<i> Hello my name is Asim </i>`

(2) Bold Tag: `<b> --- </b>`

e.g. `<html>`

`<head>`

`<title> class 9th </title>`

~~`</head>`~~

`<body>`

`<b> Hello my name is Asim </b>`

(3) Underline Tag: `<u> --- </u>`

e.g.

`<body>`

`<u> Hello my name is Asim </u>`

`</body>`

(4) Strike Tag → `<strike>` ---- `</strike>`

e.g. `<body>`
`<strike>` Hello my name is Asim `</strike>`
`</body>`

~~been~~
 20/5/26

⇒ Superscript and subscript tags:

→ 1) Superscript Tag: `<sup>` ... `</sup>`

e.g. ~~`x<sup>3</sup>`~~

`<body>`

`x<sup>3</sup>`

`</body>`

2) Subscript Tag: `<sub>` ... `</sub>`

e.g. `<body>`

`H<sub>2</sub>O`

`</body>`

⇒ Preformatting Tag:- `<pre>...</pre>`

e.g. `<body>`

`<pre> Hello`

`I`

`Ami`

`from`

`9th Rose </pre>`

⇒ Font Tag:- `<font>...</font>`

e.g. `<body>`

`<font size=25 color=green face=arial`

(Attributes) `Hello! </font>`

Date: / /
⇒ Small Tag: `<small> ... </small>`

• The size in this tag is equal to 1.

e.g. `<del>body</del> hello`
`<small> hello </small>`
`<body>`

⇒ Attributes of Paragraph Tag:

`<p align = 'right'> Hello </p>`

`<p align = 'left'> ... </p>`

`<p align = 'center'> ... </p>`

`<p align = 'justify'> ... </p>`

⇒ Attributes of Body Tag:

① `<del>html</del> <html>`
`<head>`
`<title> 9th Rose </title>`
`</head>`

Date ____ / ____ / ____

<body bg color = "red" text = "green" background = "
file path" topmargin = 33 leftmargin = 50 >

Hello I am from 9th Rose

</body>

</html>.
