

Atoms and Molecules:

- Around 500 B.C., Indian Philosopher named Maharishi Kanad postulated that matter can be divided into extremely small particles, which can't be divided further and are called as Parmanus.
- Greek Philosophers - Democritus and Leucippus gave same idea but called these indivisible particles as "Atoms".

Atom - "That can't be cut".

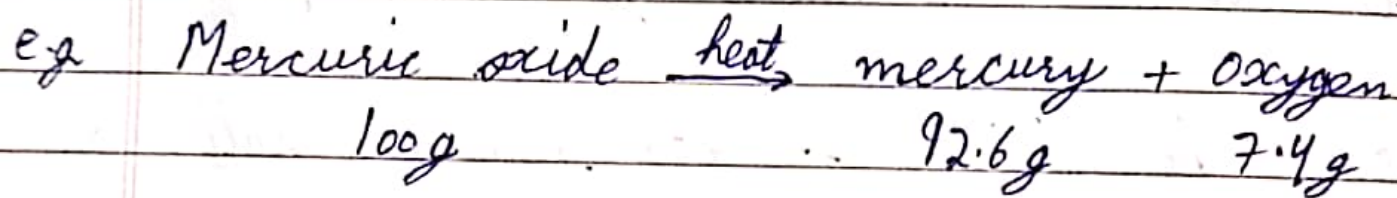

→ Laws of Chemical Combination:

- 1) Law of Conservation of mass: (By Antoine Lavoisier)
- During any physical or chemical change

the total mass of reactants is equal to total mass of products.

'OR'

"Mass can neither be created nor destroyed."

- $\text{Total mass of Reactants} = \text{Total Mass of Products}$
 $100\text{g} = 92.6 + 7.4 = 100\text{g}$
