

CSS

Cascading Style sheets

- CSS. It is a collection of rules called styles that effect the visual appearance of a Webpage
- It allows designers to specify the webpage formatting options through a style sheet while keeping html codes simple.

⇒ Simple Programme of CSS.

```
<html>
```

```
  <head>
```

```
    <title> CSS </title>
```

```
  <style> p {color: blue ; background-color: yellow}
```

```
  </style>
```

```
  <style> h {color: red } </style>
```

```
  </head>
```

```
  <body>
```

```
    <p> hello </p>
```

```
    <p> hello </p>
```

```
    <h> hello </h>
```

</body>

</html>

⇒ CSS Basic Terminologies-

1) Selector- A selector is used to select the HTML element that we want to style.

e.g. p{color: blue} → p is the selector

2) Property- A property specifies what aspect of an element we want to change.

e.g. p{color: blue} → color is the property.

3) Value- A value specifies how the property should be changed.

e.g. p {color: blue} → blue is the value.

4) Declaration- A declaration consists of a property

Date ___/___/___

and its value, separated by a colon and ending with a semicolon.

eg ~~✗~~

5) Rule- A CSS rule consists of a property selector and one or more declarations.

→ To Apply CSS. We have 3 ways

1) Inline (Attribute style)

- CSS is written directly inside the HTML element using the style attribute.

e.g. `<hr style="background-color: Yellow">`

- The style is applied only to that particular tag where the style attribute is used. If the same tag is used multiple times, the style will not be

Date ___/___/___

applied to the other occurrences automatically.

e.g.

```
<body>
  <head>
    <title> qm </title>
  </head>
  <body>
    <h1> hello </h1>
    <h2>
    <h2 style = "background-color: red"> hello
    </h2>
  </body>
</html>.
```

2) Internal or embedded style sheet

- CSS is written inside the `<style>` tag in the `<head>` section of an HTML document.

- The `<style type = "text/css">` tag tells the browser that the code inside is CSS.

Date ___/___/___

e.g. `<style type="text/css">`
`p { color: blue; }`
`</style>`

3) External style sheets-

- CSS is written in a separate .css file linked to the html document.
